

Cloud computing can be a boon for mid-market companies — as long as you are assured your data is private and secure.

Our SightSpan **Private Cloud**, part of our **Private Cloud Services** offering, resides in geographically redundant, SSAE16 Data Centers. You automatically get a disaster recovery plan included to protect your applications and data.

Our service includes virtual clouds for increased processing power when you need it and the ability to manage dedicated servers or clouds for our clients. We provide each customer with their own virtual domain through our highly available security and switching layer, which allows for the most cost-effective structure, coupled with a critical level of isolation. Our reference architecture has passed PCI compliance for a particular customer for the transmission of data, which validates the security and isolation of the architecture.

The SightSpan server farm is dedicated to individual enterprises, enabling clients to maximize flexibility for their respective Private Cloud Solutions. As the physical servers are dedicated to you, we can architect from the ground up, building a custom solution that meets your individual business and auditing requirements.

Private Cloud through SightSpan Cloud Services

- Cloud Environment to Host Client Applications
- Replication of Data and Applications
- 24x7x365 L1 – L3 Help Desk
- ALL OS patching (provided client signs up for optional OS MGMT)
- Can support Linux and/or Windows Servers
- Optional Application Monitoring and/or Management
- Stringent Security to protect applications and data
- Simple Pricing model – per server pricing

All services are **fully supported and managed by our team of experts 24x7x365**. SightSpan Solutions ensures business continuity for customers through its multiple data centers, each of which is a mirror of the other, are always online, and ready should there be a disaster — natural or other.
